PROFILE

Computer Science student at the University of the Philippines Los Baños with experience building full-stack data platforms and applied machine learning prototypes in Python, including a live PSE screening site and two award-winning hackathon prototypes.

EDUCATION

B.S. Computer Science August 2024 – Present
University of the Philippines Los Baños

TECHNICAL SKILLS

Languages: Python, JavaScript, Java, C, SQL, HTML/CSS
Frameworks & Data: FastAPI, Django, Flask, React (Vite), Flutter, PostgreSQL/PostGIS, SQLite, MariaDB
ML & Tools: PyTorch, TensorFlow, Keras, OpenCV, Git/GitHub, REST & WebSocket APIs

EXPERIENCE & PROJECTS

RK Operator Ledger — Full Stack Developer July 2026
Personal project — live at rkoperator-ledger.com

- Architected a live Philippine Stock Exchange (PSE) screening site that converts EDGE disclosures for 200+ listed companies into searchable, filing-backed metrics.
- Wrote a Python ETL pipeline that scrapes 238 PSE EDGE HTML files and ranks 2,264+ disclosure PDFs into SQLite, parsing thousand/million/billion scale notes so ratios use filing-backed figures instead of quote-API values.
- Exposed the database through a Django REST API consumed by a React (Vite) frontend with 12+ indicators (P/E, P/B, ROE, ROIC, TTM yield, D/E), watchlist, and multi-ticker compare.

Pathag — Team Leader March 2026
Hackathon prototype — EXPE21ENCE YSES: The HackFest, Collegiate Champion

- Led a five-member team to the Collegiate Champion title, shipping Pathag, a pedestrian-accessibility navigation prototype for the UPLB campus.
- Engineered the FastAPI backend on PostgreSQL/PostGIS that ranks 5+ campus walking paths by accessibility, exposing 3 REST endpoints and a WebSocket channel for obstacle reports, crowd-sourced verification, and LGU heatmap exports.
- Integrated MobileNetV3 image classifiers (6-class path condition, binary obstacle detection, verifier gates) and a Flutter prototype client, gating route influence behind verification thresholds.

KitaCred — Team Leader August 2025
Hackathon prototype — BPI Data Wave 2025, Track 2, 1st Place

- Directed a team of four to 1st place in Track 2 with KitaCred, a Python microfinance assessment tool built for BPI.
- Prototyped a PyTorch alternative-data trust score that screened 50+ sample applicants in the final demo, folding Eskwelabs mentor feedback into each iteration.
- Delivered a 3-step interactive XAI mockup of the assessment flow aligned to BPI's stated needs for the final pitch.

CIEL — One-Shot Facial Verification August 2025
Personal project — github.com/SenjoNanaya/One-shot-Image-Recognition

- Built a one-shot facial verification system in TensorFlow/Keras/OpenCV using a Siamese network (Koch et al., ICML 2015) that matches live webcam frames to enrolled faces.
- Trained the model for 50 epochs (Adam, BinaryCrossentropy) and calibrated 0.5 detection and verification thresholds to achieve 15+ FPS real-time verification.

TAP:SCANS — RFID Attendance Capstone July 2024
Senior High School Capstone

- Conducted a 30-teacher survey study for a Python RFID attendance tracker (Google Sheets + Glide), analyzing responses with Pearson correlation and regression to validate adoption drivers.
- Presented findings at Networked Learning PH 2024, an international conference.
